“KNOWING AND SHOWING”

USING U.S. SECURITIES LAWS TO COMPEL HUMAN RIGHTS DISCLOSURE

A REPORT BY
THE INTERNATIONAL CORPORATE ACCOUNTABILITY ROUNDTABLE (ICAR)

ENDORSED BY
PROFESSOR CYNTHIA WILLIAMS
Endorsement

This document has been reviewed, edited, and endorsed by Professor Cynthia A. Williams.

Professor Cynthia A. Williams joined Osgoode Hall Law School on July 1, 2013 as the Osler Chair in Business Law, a position she also held from 2007 to 2009. Before coming to Osgoode, she was a member of the faculty at the University of Illinois College of Law and, prior to that, she practiced law at Cravath, Swaine & Moore in New York City.

Professor Williams writes in the areas of securities law, corporate law, corporate responsibility, comparative corporate governance, and regulatory theory, often in interdisciplinary collaborations with professors in anthropology, economic sociology, and organizational psychology.

Professor Williams’ work has been published in the Georgetown Law Journal, the Harvard Law Review, the Journal of Corporation Law, Theoretical Inquiries in Law, the University of New South Wales Law Journal, the Virginia Law Review, and the Academy of Management Review.

Acknowledgment

ICAR would like to acknowledge the following individuals who participated in the production of this report: Stephen Winstanley, Katie Shay, Sara Blackwell, Kendall Scott, Mike Lally, and Caitlin Peruccio.

Introduction

After decades of economic globalization and trade liberalization, traditional legal and regulatory enforcement systems have proved to be inadequate in holding corporations accountable for the adverse social impacts of business activities. Due partly to limitations on courts’ jurisdictional authority over extraterritorial activities of corporations and weaknesses in the rule of law in operating jurisdictions, corporations have functioned in an environment where regulations that are intended to hold them accountable for the way in which they conduct business are insufficiently enforced. Yet, public reaction to recent corporate disasters such as the factory collapse at Rana Plaza in Bangladesh, the adoption of socially responsible investment policies by a broad cross-section of investors, and international policy convergence on the responsibility of businesses to respect human rights all indicate that human rights concerns related to business activities are relevant and material to a broad set of stakeholders.

In recent years, public attention on business-related human rights abuses has grown in a wide variety of industries. Popular disapproval of corporate complicity in human rights violations has manifested in the form of direct boycotts by consumers, as well as pressure from an investor community that is increasingly interested in social issues. For instance, the garment industry has received widespread and largely negative attention after multiple deadly factory disasters in Bangladesh, including the Tazreen Fashions fire that killed 114 workers in Dhaka on November 24, 2012 and the Rana Plaza factory collapse on April 24, 2013 that left more than 1100 workers dead. In addition, the information and communications technology industry has struggled to effectively self-regulate and monitor labor standards in its supply chains, as demonstrated by the frequent publicity surrounding the harsh conditions facing workers at the FoxConn factory complex in China. The extractives industry has similarly faced scrutiny for adverse working conditions, human rights abuses by security personnel at mines, forced labor and other modern forms of slavery, and the contamination of ground water supplies.

In response to these types of incidents, consumers have increasingly taken direct action to boycott and encourage divestment from socially irresponsible companies. Certification labels such as “Rainforest Alliance” and “Fair Trade” have become sought after by companies in order to market their products to socially-motivated purchasers. Moreover, investors are adopting socially responsible policies to guide their decisions and are expecting valuable returns on their outlays as a product of doing so, as indicated by the rising asset values of socially responsible investment funds in the United States over the past two decades (from $639 billion in 1995 to $3.74 trillion in 2012). Mainstream institutional investors, including institutional mutual and equity funds, have also signed onto international principled investing standards, joining more than 1188 signatories to the United Nations Principles for Responsible Investment—altogether commanding a total of more than $34 trillion (or over 15% of the world’s investable assets) in market capital.
A company’s reputational risk—the material damage to a company’s reputation as a result of social missteps—can therefore result in significant business costs. As has been shown in a multitude of instances, consumer and client preferences can change dramatically upon the discovery of human rights risks. Employees, recruits, investors, and shareholders alike may seek to disassociate from a corporation that is implicated in human rights violations. This ripple effect from the discovery of human rights risks and impacts can negatively alter any competitive advantages that a business might have because of changes in public perception. For example, the rise in popularity of “fair trade” coffee illustrated this effect when major coffee shops faced backlash and demands from customers before agreeing to serve fair trade certified coffee. Now, more than ever, consumers and investors are making the conscious decision to purchase from and invest in companies that utilize an ethical supply chain and are not complicit in human rights violations. As such, companies should reasonably expect consumers and investors to prefer and even demand complete and accurate information concerning human rights risks before making the decision to purchase or invest.

In the absence of enforceable and uniform regulations for corporate accountability at the global level, domestic law must work to answer this call for corporate accountability. U.S. securities regulation is a key and promising area for such domestic efforts as it is based on a philosophy that uses transparency to allow market actors to hold corporations accountable for social conduct and standards. This paper applies that purposeful logic to provide a road-map for how U.S. securities laws can be used to create conditions for investors to hold companies accountable for their social and human rights impacts. Market actors can and should motivate companies to act more responsibly regarding their impact on human rights by allocating capital resources to more responsible companies. However, market actors can only do so if there is transparent, clear, and comparable disclosure of those human rights risks and impacts, as well as the policies and procedures that are related to the assessment and management of such risks and impacts.

This paper argues that human rights are materially relevant to corporate securities reporting and encourages the U.S. Securities and Exchange Commission (SEC) to guide businesses in reporting material human rights information in their periodic and proxy disclosure reports. First, the paper outlines the legal framework for securities disclosure regulations that are relevant to human rights. Second, the paper explains the methodology for assessing whether information related to corporate activities is material and uses this methodology to analyze whether human rights information is material to corporate securities disclosures. Finally, the paper proposes a plan for implementing disclosure of material human rights information related to business activities, incorporating human rights due diligence standards at the global level to assess and identify material human rights risks and impacts.

As part of this proposed plan, this paper identifies two alternative and complementary actions that the SEC could take to clarify precisely how issuers should disclose material human rights information. First, given its authority to issue interpretive guidance, the SEC should provide such guidance in order to explain how material human rights information should be incorporated into
existing securities reporting items. Second, given its authority to promulgate new regulations for the public interest or the protection of investors, the SEC should promulgate a new rule specifically requiring disclosures of human rights information, organized in a new reporting item for periodic reports or proxy disclosures. Interpretive guidance would facilitate mandatory reporting under existing rules by clarifying the materiality of human rights information to investors, whereas a new rule could establish clear and organized disclosure of human rights matters in a new reporting item, enabling investors to easily review this information in their capital allocation decisions.
The Legal Framework: U.S. Securities Reporting Standards

The SEC was established by the Securities Act of 1933 ("Securities Act") and the Securities Exchange Act of 1934 ("Exchange Act"). Its mission is to promote the public interest by protecting investors, facilitating capital formation, and maintaining fair, orderly, and efficient markets. More recently, the Sarbanes-Oxley Act of 2002 and the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 were passed in response to accounting scandals and securities market abuses that destabilized the domestic and global economy, further impacting the SEC’s mission and mandate.

The intellectual architects of the U.S. securities regulation system favored the use of transparency as a regulatory mechanism, not only to ensure accurate pricing of securities in the marketplace, but also to motivate changes in business behaviors by exposing corporate conduct to public scrutiny. Based on this foundational architecture, transparency became one of the primary mechanisms for implementing the investor protection and public interest purposes of U.S. securities regulations. The debates within the U.S. House of Representatives on both the Securities Act and the Exchange Act clearly indicate that public disclosure of information was intended to affect the way business is performed, including in ways that increase the social responsibility of business conduct.

This section will outline the legal framework of securities law in the United States. Corporate securities reporting essentially involves two steps: (1) identifying and collecting the type of information required for disclosure under securities regulations and (2) filtering that information by determining what is “material” for disclosure to the SEC, investors, and shareholders.

A. The Disclosure Provisions

Securities-issuing entities are required to publicly report information to enable investors and shareholders to make informed investment decisions and allocate capital resources efficiently. Under U.S. securities law, issuers must disclose information publicly to the SEC at the following regular intervals: (1) at the initial public issuing of securities, (2) at registration of securities, (3) at quarterly and annual periodic intervals, (4) as part of proxy solicitation disclosures for the annual shareholders meeting, and (5) at the occurrence of extraordinary events such as a tender offer, merger, or sale of the business. The integrated disclosure requirements for registered securities are organized in the comprehensive Regulation S-K (or Regulation S-B for small businesses). Additionally, shareholders have the authority to demand disclosures beyond those required under Regulation S-K by using their power to bring resolutions during the proxy solicitation process for annual shareholders meetings. These regulations are buttressed by a number of other rules: (1) Rule 408, promulgated pursuant to the authority of the Securities Act, and Rule 12b-20 of the Exchange Act, both of which require additional disclosure of material
information necessary to ensure that required disclosures are not misleading,\textsuperscript{34} and (2) Rule 10b-5, promulgated pursuant to the authority of Section 10(b) of the Exchange Act, which establishes legal liability for those responsible for fraudulent or untrue statements or omissions in disclosures connected with the purchase or sale of securities.\textsuperscript{35}

In order to ensure that the information disclosed in securities reports is useful to investors, issuers are only required to report information that is “material” to the users of their reports.\textsuperscript{36} In the case of periodic securities reports, the intended users are potential investors and existing shareholders. Materiality is both an accounting and securities law concept for classifying information as significantly relevant to understanding the past, current, and future value and performance of the issuer’s securities. It is judged based on factoring the quantitative and qualitative importance of the information in evaluating the issuer and in relation to the intended users of the report.\textsuperscript{37} For securities reports, information must be disclosed that is: (1) specifically required under Regulation S-K or necessary to ensuring that required disclosures are not misleading\textsuperscript{38} and (2) material to investors’ or shareholders’ decision-making processes in accurately valuing securities, in particular for the purpose of choosing to buy or sell securities.\textsuperscript{39}

\textbf{I. Regulation S-K and Periodic Disclosure of Non-Financial Information}

Regulation S-K outlines the standard instructions for corporate securities disclosures required by U.S. securities regulations. These regulations inform the initial obligation to disclose specific types of information in prospectuses for the sale of new securities, in companies’ periodic and extraordinary occurrences reports, and in companies’ proxy statements in conjunction with their annual meeting. In addition to a company’s registration statement, there are four primary categories of disclosures for periodic reporting, including descriptions of the registrant’s (1) business, (2) securities, (3) financial information, and (4) management.\textsuperscript{40} Issuers are required to provide periodic disclosures quarterly on the SEC’s Form 10-Q and annually on the Form 10-K.\textsuperscript{41}

Several provisions of Regulation S-K require descriptive disclosures that may incorporate material non-financial information. Key provisions that require discussion of non-financial information include Item 101 (description of business), Item 103 (legal proceedings), Item 303 (management’s discussion and analysis), Item 307 (disclosure controls and procedures), and Item 503(c) (risk factors).\textsuperscript{42} The SEC occasionally issues interpretive guidance releases to clarify the information issuers are expected to disclose and how the Commission staff evaluates disclosures by issuers.\textsuperscript{43}
Description of Business, Item 101

The description of business under Item 101 should indicate general developments in the business during the previous five years, including any material changes in the mode of doing business and a forward-looking description of the plan of operation for the next reporting period. Depending on the timing of the report, projections must outline the plan for the remainder of the fiscal year or for that period and an additional six-months into the next fiscal year. This item includes three primary disclosures: (1) general development of business, (2) financial information about business segments, and (3) a narrative description of business.

The narrative description of business requires disclosures encompassing all areas of the business operations. An issuer must disclose the principal products and services involved in the issuer’s business, the status of each business segment or new product (e.g. planning, prototype, design-selection, re-engineering stages), the sources and availability of raw materials, the status and importance to the business valuation of all intellectual property, and the extent to which business segments are or may be seasonal in nature. There must be a description of the principal methods of competition and positive and negative factors related to the issuer’s competitive position should be reported. Finally, material effects on capital expenditures from compliance with federal, state and local provisions related to environmental protection must be explained appropriately.

Legal Proceedings, Item 103

Under Item 103, issuers must disclose information relating to any pending legal proceedings involving the issuer, any of its subsidiaries, or any of their property as a party to litigation where the proceedings could have a material impact on the issuer. This reporting requirement is limited in scope by the qualifications that pending litigation must be other than routine litigation incidental to the business, and it must have the potential to result in damages exceeding ten percent of the issuer’s current assets. Where several cases based on the same legal or factual issues are pending or are being contemplated, the amount of potential damages must be calculated by aggregating the claims. These limitations do not directly apply where the proceeding arises from a law or regulation for the purpose of environmental protection or where a governmental authority is a party to the proceeding and it involves potential monetary sanctions of more than $100,000. In each of these cases, an issuer may only limit their reports if the proceeding’s outcome is immaterial to the business or financial condition of the issuer or if the penalty where the government is a party is unlikely to be an actual fine of $100,000 or more.
Management’s Discussion and Analysis, Item 303

Management’s Discussion and Analysis (“MD&A”) under Item 303 is intended to provide a narrative description of management’s views concerning the financial condition of the company and the results of business operations, with a particular emphasis on future prospects and risks. This section should add value to the overall disclosures provided by the company and supply a contextual basis for investors to analyze financial information. To do so, the MD&A must include reporting covering three subjects: liquidity, capital resources, and results of operations. Detailed instructions of explicit requirements in discussing each of these subjects are found in Instruction 5 to Item 303(a). Essentially, the reporting requirements focus on management identifying any known trends, events, or uncertainties that will or are “reasonably likely” to result in favorable or unfavorable material effects to the issuer’s liquidity, capital resources, or operating results—such as net sales, revenues, or costs from continuing operations. These disclosures are intended by the SEC to be made in a meaningful, company-specific manner and should not use “boilerplate” phrasing and generalities.

Disclosure Controls and Procedures, Item 307

Item 307 requires an issuer’s principal executive or financial officers, or the functioning equivalent, to disclose their conclusions regarding the effectiveness of internal disclosure controls and procedures. This will require a short, narrative explanation of the executives’ understanding of the internal processes and an affirmation of the effectiveness of the procedures that are in place. Generally, this will require disclosure outlining the due diligence and auditing measures the company uses to identify, assess, and evaluate required categories of information in preparation of the annual, quarterly, and special reports required by securities regulations.

Risk Factors, Item 503(c)

Item 503 is specific to prospectus disclosure as initially promulgated, but is recently incorporated into Item 1A for quarterly and annual reporting. In Item 503, the issuer is required to briefly summarize their prospectus in plain English, including a distinct section captioned “Risk Factors” to discuss the most significant factors that make the offering speculative or risky. This typically includes risks of changes in the competitive landscape or market demand, fluctuations in political stability or other operating conditions, climate change risks and associated cost increases, and other such unpredictable variations in the business environment that may damage capital formation or financial performance. This narrative discussion is specifically required to be “concise and organized logically,” with risks presented that are tailored to the specific issuer
and their business. It must be placed immediately following the summary section or any price-related information or directly after the cover page, if there is no summary.

The risk factor discussion must explain how the risk affects the issuer and clearly express each risk factor in a sub-caption that adequately describes the risk. The description of Item 503(c) in Regulation S-K specifically identifies risk factor categories in a non-exhaustive list, including lack of an operating history, lack of profitable operations in recent periods, financial position, business or proposed business, and the lack of a market for the issuer’s common equity securities. The list provided is suggestive, but item 503(c) is clear that all of the most significant factors that make the offering speculative or risky must be disclosed.

II. Shareholder-Demanded Disclosure Using Shareholder Resolutions, as Permitted Under Exchange Act Section 14(a), Regulating Proxy Solicitations and the SEC’s General Powers Under Section 14(a)

Company-specific disclosure may also arise based on a successful shareholder resolution (also called shareholder proposals). Under state corporate law, securities owners have the power to put appropriate items on the annual meeting agenda. In Section 14(a) of the Exchange Act, the SEC is given general authority to regulate the process of soliciting proxies in conjunction with the annual meeting. In Rule 14a-8, the SEC has identified the procedural and substantive requirements for shareholders’ resolutions. If a shareholder resolution asking for information from the issuer receives majority support in the proxy solicitation process, then the information may be forthcoming.

Companies may seek a no-action position from the SEC staff to protect them from later SEC enforcement action if the company decides not to include certain shareholder resolutions in the company’s annual proxy statement. Permissible reasons to exclude shareholder proposals are set out in Rule 14a-8, question 9. Exclusion may be permissible based on the proposal violating one of the eligibility or procedural requirements of Rule 14a-8 or if it falls within one of the rule’s thirteen substantive bases for exclusion. If there is no basis to exclude a shareholder proposal, the issuer must include the proposal in its proxy solicitation for shareholders to consider.

Additionally, under the broad authority delegated to the SEC by Section 14(a) of the Exchange Act, the Commission is entitled to regulate the proxy solicitation process “as necessary or appropriate in the public interest or for the protection of investors.” It has been argued that this mandate was intentionally designed to allow the SEC to establish rules that would permit shareholders to hold companies accountable for their actions, including by promulgating proxy disclosure rules that would provide shareholders with more information about the companies’ actions. The challenge for any proponent of new proxy disclosure rules lies in gaining
sufficient support for any proxy disclosure request in order to instigate the SEC rule-making process under section 14(a).

III. Rules 408 and 10b-5: Ensuring Completeness, Accuracy, and Responsibility in Disclosures

Supplementary provisions of the Securities and Exchange Acts buttress the specific disclosure requirements in Regulation S-K. First, Securities Act Rule 408 and Exchange Act Rule 12b-20 provide a “catch-all” requirement to disclose any further material information necessary to ensure the overall disclosures are not misleading. Then, Rule 10b-5 attaches personal liability for fraud, misstatements, or omissions to the individuals responsible for preparing and certifying the disclosures as true, accurate, and complete. These provisions act to complement disclosure requirements and ensure that managers and internal reporters have incentives to ensure that the information they are disclosing is complete, accurate, and true.

According to Securities Act Rule 408 and Exchange Act Rule 12b-20, issuers are required to add any material information necessary to ensure their disclosures are not misleading. The specific language of both Rule 408 and Rule 12b-20 require “such further material information, if any, as may be necessary to make the required statements, in light of the circumstances under which they are made, not misleading.” These rules act as a “catch-all” to ensure that issuers are required to disclose any additional material information necessary to ensure that information disclosed is not misleading—in essence, to guard against half-truths.

Section 10(b) and Rule 10b-5 of the Exchange Act create liability for using deceptive or manipulative devices in connection with the purchase or sale of securities. In particular, according to Rule 10b-5 (b) it is unlawful for any person to directly or indirectly “make any untrue statement of a material fact or to omit to state a material fact necessary in order to make the statements made, in the light of the circumstances under which they were made, not misleading . . . in connection with the purchase or sale of any security.” This liability, in relation to periodic securities disclosures, attaches to the individuals involved in preparing the statements of material fact and to those who are required to certify that the material statements of fact are true and complete—usually the Chief Executive Officer, Chief Financial Officer, or similarly empowered high-level executive. This liability applies to materially misleading statements even where there is no affirmative duty to disclose such information.

In making a claim for violation of Rule 10b-5, the plaintiff must prove several elements. They must show: (1) that the defendant is subject to Rule 10b-5, (2) that there was a misrepresentation or omission, (3) of a material fact, (4) made with the intent to deceive or recklessness in the misstatement, (5) upon which the plaintiff relied, (6) in connection with either a purchase or sale of a security (7) causing (8) damages. While reliance is a part of the plaintiffs’ case, it may be presumed in certain cases. In omission cases, reliance may be presumed if the omission is of a
material fact, and in misstatement cases there is a rebuttable presumption of reliance when the security is trading in an efficient market since the misstatement will operate as a “fraud on the market,” affecting the market price.⁷⁸ Therefore, incentives are created to promote accuracy and completeness in periodic disclosures in part because the individuals responsible for preparing the information and certifying the disclosures may be personally liable for any fraudulent material inaccuracies or omissions.

B. What is “Material” for Corporate Disclosures?

The first part of the disclosure process involves collecting information based on the items specifically required under Regulation S-K, any information demanded by successful shareholder disclosure proposals, and the blanket requirements to include additional material information as necessary to ensure the disclosures are not misleading. Once this information is gathered, the issuer must determine what information is “material” and thereby subject to public disclosure and what information is immaterial and thereby not required to be disclosed publicly.⁷⁹ The second part of the disclosure process requires a subjective filtering of information related to required disclosure items through a screen of materiality, with the goal of ensuring that public disclosures are useful to investors and shareholders in assessing current and prospective corporate performance.

The Supreme Court of the United States has laid out a clear legal standard for identifying what is “material” for securities reporting. The standard is driven by the rationale behind the Securities Acts to “substitute a philosophy of full disclosure for the philosophy of caveat emptor and thus to achieve a high standard of business ethics in the securities industry.”⁸⁰ It is tempered by the judicial concern that “a minimal standard might bring an overabundance of information within its reach,”⁸¹ and lead management to overburden the market with disclosures that did not enable “informed decision-making.”⁸²

A fact is material if “there is a substantial likelihood that a reasonable investor would consider it important” and would have viewed the information “as having significantly altered the ‘total mix’ of information made available.”⁸³ The Court explains that assessing whether a fact is material “requires delicate assessments of the inferences a ‘reasonable shareholder’ would draw from a given set of facts and the significance of those inferences to him.”⁸⁴ Whether a fact is material “depends on the significance the reasonable investor would place on the . . . information.”⁸⁵

Regarding speculative or contingent information, including much forward-looking information, Supreme Court precedent calls for companies to balance “the indicated probability the event will occur and the anticipated magnitude of the event in the light of the totality of company activity.”⁸⁶ Adopting the reasoning from earlier cases, the Court expects the significance of each fact to be assessed in relation to all other available information.⁸⁷
The SEC has provided additional guidance in recent years to assist companies with determining materiality. In Staff Accounting Bulletin No. 99 ("SAB 99"), the SEC clarifies that materiality cannot be determined based on a bright-line quantitative criterion alone and that even information that is purely qualitative could, in the context of all other available information, be material to corporate securities disclosures.\(^8\) In particular, SAB 99 dispelled the popular rule-of-thumb that any fact which could not result in a financial impact of at least 5% on any quantitative category was not material.\(^9\) SAB 99 provided some guidance for accountants to consider qualitative characteristics in determining materiality by listing hypothetical situations where qualitative information would be considered material by SEC staff.\(^10\)

Materiality determinations require the accountants and managers preparing securities reports to assess the qualitative and quantitative characteristics of information to identify information that a reasonable investor would consider important enough to significantly alter the "total mix" of information available.\(^11\) The certainty or uncertainty of a fact, trend, or event’s occurrence—and the nature and scope of the impact on corporate performance of that occurrence—will all affect whether it is material.\(^12\) These subjective determinations should be guided by balancing the purposes of securities regulation in providing sufficiently accurate, detailed, and comparable information to protect investors and ensure fair, orderly, and efficient markets against a judicious temperance to refrain from overwhelming the market with a flood of useless information.\(^13\)
Demonstrating Materiality: Human Rights Impacts, Risk Assessments, and Procedures Are Material for Corporate Securities Disclosures to the S.E.C.

Materiality derives from the general public, international and national governments, and businesses treating a particular area or impact of business activity with heightened interest. In 2010, the SEC re-evaluated the materiality of information related to climate change in light of increasing interest from the public, academics, businesses, domestic and international government, and other stakeholders. In doing so, the Commission outlined the process for considering whether a topic has become popularly relevant to the level of “material” to corporate reporting. Key factors considered include: heightened public interest in recent years (including academic, government, business, investors, analysts, or the public at large); international accords and efforts to address a topic of concern on a global basis; federal regulations or state and local laws in the United States; and voluntary recognition of the current and potential effect of the category of information on companies’ performance and operations by business leaders. The SEC addresses these key factors by analyzing the level of interest in climate change according to three primary elements: (1) recent regulatory, legislative, and other developments; (2) the potential impact of climate change related matters on public companies; and (3) current sources of climate change-related disclosures regarding public companies. Within each element, the materiality of any category of information is supported by trends of public interest, international community action, domestic legislative action, and voluntary business action expressing an acknowledgment of material significance.

This section provides evidence that the significance of human rights information to investors and the public has evolved to a level that requires its disclosure as material information in securities reports. First, recent regulatory, legislative, and other developments in the US and international spheres are presented. Second, the potential impacts of human rights-related matters on public companies are outlined using examples from recent years. Finally, current sources of human rights-related disclosures regarding public companies are outlined. This evidence supports the conclusion that human rights are material to investors. Securities regulations must recognize this materiality by providing guidance for issuers to disclose information related to human rights risks and impacts in a clear, consistent, and comparable manner in their reports to the SEC.

A. Recent Regulatory, Legislative, and Other Developments

Legislators, regulators and international policy-makers have indicated that the human rights risks and impacts arising from globalized business activities require concerted global action. Domestic
legislators and regulators in the United States have adopted public policies and rules at the federal, state, and local levels that address corporate social responsibility and enhance corporate transparency relating to human rights. The international community has endorsed defined roles for States and businesses in the UN’s “Protect, Respect, Remedy Framework” and the “Guiding Principles” for implementing this framework in the business and human rights context. Furthermore, the United States government has endorsed the Guiding Principles and has been encouraged by members of civil society to develop a plan for national implementation. Stakeholders in business and civil society have come together with initiatives to develop particular standards and processes for addressing human rights risks and impacts through voluntary action.

I. Federal Government Regulatory Efforts

Federal legislators and administrative agencies in the United States have used their authority to promote corporate respect for human rights and to provide greater transparency to investors and the public on human rights risks and impacts related to business activities. In the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010, Congress required transparency from companies in special securities disclosures to address corruption and bribery, mine safety, and conflict minerals sourcing. The SEC interpretive guidance for disclosures related to climate change and to cyber-security information has directed companies to disclose socially important information similar to human rights concerns under existing securities disclosure rules in Regulation S-K. Finally, the State Department issued rules requiring transparency for new investments in Burma in May 2013.

Dodd-Frank Special Disclosure Provisions

In the Dodd-Frank Act of 2010, the U.S. Congress employed the mechanism of securities disclosures to require transparency regarding mine safety, payments by resource extraction companies to governments, and supply chain due diligence by manufacturers who source minerals from the Congo region of Africa. These provisions directed the SEC to issue rules requiring issuers to disclose information related to these three activities with the apparent goals to enhance awareness about dangerous mining conditions, combat corruption in foreign governments, and eliminate funding for armed groups perpetuating conflict and human rights violations in the Congo. Although Congress determined that these purposes fit within the mandate of the SEC, some observers have questioned the role of the SEC in compelling disclosures of this information and the materiality to investors. Investors, meanwhile, have commented on the rule-making processes for each section and provided considerably favorable
feedback as they seek access to information regarding the social and human rights impacts of business activities of issuers conducting operations in conflict-affected and weak governance areas.  

Section 1502 of the Dodd-Frank Act mandates that the SEC issue a rule requiring companies to determine whether certain minerals used in the production of their manufactured goods originated in the Democratic Republic of Congo (DRC) or neighboring countries and whether the trade in those minerals has financed or benefitted armed groups. The SEC rule implementing Section 1502 requires companies that file reports with the SEC to determine whether they source designated minerals from this region. If they do, and those minerals are necessary to the functionality of the manufactured goods they are used to produce, the company should be required to conduct supply chain due diligence to determine whether their mineral purchases are providing funding directly or indirectly to armed groups perpetuating conflict and violence in the DRC.  

As part of the required disclosures, companies must describe the specific measures taken to exercise due diligence. The rule follows a “comply or explain” philosophy, requiring companies to comply and show their efforts or explain their non-compliance and show what efforts they have undertaken to comply.  

Section 1503 of the Dodd-Frank Act calls for the SEC to require specific periodic disclosure by issuers operating coal or other mines of information detailing health and safety violations or a pattern of such violations in their operations. The SEC rule implementing this disclosure is based on the Federal Mine Safety and Health Act of 1977 (Mine Safety Act) and expands the level of detailed information about mine safety issues that must be publicly disclosed. This rule requires issuers to report the receipt of certain notices from the Mine Safety and Health Administration (MSHA) on current report disclosure Form 8-K, which must be filed within four business days of specific material events to provide an update to quarterly or annual reports. Further, the rule requires that quarterly and annual reports include aggregated totals for: (1) health and safety violations, orders, or citations under the Mine Safety Act; (2) the potential costs of proposed assessments from the MSHA under the Mine Safety Act; and (3) mining-related fatalities during the reporting period.  

Finally, Section 1504 authorizes the SEC to demand resource extraction companies disclose any and all payments made to domestic or foreign government officials. Under this requirement, companies are expected to submit information to the SEC in interactive data format, detailing: (1) total amounts of payments by category, (2) the business segment that made the payments, (3) the government that received the payments, (4) the country in which they are located, and (5) the project of the issuer to which the payments relate. The SEC is given authority to require any other information considered “necessary or appropriate in the public interest or for the protection of investors.” This rule may be limited by a de minimus exemption, allowing companies to refrain from disclosing very minimal payments, but the statute indicates the Commission should be guided in its rulemaking by the guidelines set out in the Extractive Industries Transparency
Initiative—a voluntary international multi-stakeholder initiative for extractive companies and governments to publish payments made and received related to resource extraction projects. Critics of these specialized disclosure requirements argue that they go beyond the scope of the SEC’s authority by targeting public policy goals unrelated to investor protection, market efficiency, or capital formation. They argue that the original purpose of the SEC is being manipulated for federal policy-making goals because the SEC is the only regulatory body capable of commanding regulatory compliance goals. However, these criticisms appear to fail to consider the legislative mandate to the SEC to regulate “as necessary or appropriate in the public interest or for the protection of investors,” as in Section 14(a) of the 1934 Act. These criticisms also fail to consider the legislative history describing the original intended purposes of federal securities regulation, which have been argued to include establishing greater social responsibility in corporate conduct. Congress has the authority to mandate rulemaking on specific items where it is deemed in the public interest. Investor groups have actively advocated for the materiality of the information to be disclosed under these provisions for their decision-making processes.

SEC Guidance on Climate Change and Cyber-Security

The SEC has recently been engaged in clarifying the disclosure requirements of non-financial information related to climate change and cyber-security in securities reports. Each of these releases has indicated how existing securities regulations may require disclosure of information related to climate change or cyber-security matters where they are material to the issuer or any of its business segments. Both discuss how the costs of compliance with laws and regulations to prevent and mitigate risks related to climate change or cyber-security may result in material expenses necessary to report in financial disclosures. Further, both detail how the description of business, legal proceedings, MD&A, and risk factors items in Regulation S-K may compel issuers to address cyber-security or climate change risks or incidents. The climate change guidance identifies specific provisions in Regulation S-K that have been enacted during the past four decades of rulemaking and interpretive guidance on disclosures related to environmental protection or climate change matters. The cyber-security guidance also details how the disclosure controls and procedures section may require disclosure of the effectiveness of cyber-security measures or any deficiencies that could render them ineffective.

State Department Responsible Investment in Burma Reporting Standards

The U.S. Department of State recently released their Responsible Investment Reporting Requirements for all U.S. businesses investing more than US$500,000 in Burma, effective May
Companies must publicly provide summaries or copies of the policies and procedures relating to operational impacts on human rights, community and stakeholder engagement in Burma, and grievance processes. They must outline their human rights, worker rights, anti-corruption, and environmental due diligence policies and procedures, including those related to risk and impact assessments. Further, they must report to the State Department their policies and procedures relating to security service provision and military communications.

**Foreign Corrupt Practices Act**

Congress has been involved in regulating corporate conduct in transactions and business activities abroad at least since 1977, when it passed the Foreign Corrupt Practices Act (FCPA), prohibiting the use of bribery to foreign government officials to assist in obtaining or retaining business. The prohibition of promises, offers, or payments of bribes to foreign officials applies anywhere in the world and extends to public companies and their officers, directors, employees, stockholders, and agents—including consultants, distributors, joint-venture partners, and others. The FCPA also requires that issuers (1) make and keep books and records that accurately reflect the corporation’s transactions and (2) put in place a system of internal accounting controls to adequately oversee and account for corporate assets and transactions. These records and internal controls help the issuer identify, prevent, mitigate, and remedy any offending conduct.

**II. State and Local Government Regulations or Laws**

States have the primary legislative authority to regulate corporate governance and liability in U.S. law. Several states have engaged their legislative authority or are considering laws to address human rights risks and impacts arising from business activities. In 2011, California became the first state to pass a law preventing companies under scrutiny for ineffective compliance with the Dodd-Frank conflict minerals supply chain reporting requirements from eligibility to bid on state procurement contracts. Maryland passed a similar law in 2012, and Massachusetts is presently considering legislation to follow suit. Additionally, California has enacted the Transparency in Supply Chains Act of 2010, requiring transparency related to corporate efforts to monitor supply chains to combat slavery or human trafficking. Through these laws, legislators in California, Maryland, and Massachusetts are clearly indicating that they are interested in holding corporations accountable for their conduct abroad, including the direct or indirect financing of conflict and crimes against humanity in their supply chains for mineral resources.
III. International Community Actions to Address Business and Human Rights Concerns on a Global Basis

The international community has taken actions at several levels to address business and human rights concerns on a global basis. The United Nations has engaged stakeholders and developed frameworks for global action through defined roles of governments and businesses in upholding human rights, standards for responsible and principled investing, and guiding principles for businesses to implement their responsibilities to respect human rights.143 International organizations such as the Organization for Economic Co-operation and Development (“OECD”) and the International Organization for Standardization (“ISO”) have also released guidelines for businesses to implement their social and human rights responsibilities that incorporate and expand upon the standards of the Guiding Principles.144 The European Union is currently preparing legislation to require corporations to publicly disclose information related to human rights and other non-financial social and environmental impacts of business activities.145 Additionally, businesses, governments and civil society groups have come together voluntarily in multi-stakeholder initiatives (“MSIs”) to address particular concerns and create best practices approaches in the form of standards and mechanisms to protect against adverse human rights risks and impacts of business activities.146 Each of these international mechanisms will be discussed in turn.

**UN Frameworks and International Standards**

The United Nations has progressed from voluntary multi-stakeholder initiatives—such as the UN Global Compact147—to consultative approaches seeking to develop international standards that can be incorporated into domestic laws and that follow the “Protect, Respect Remedy” Framework148 and the Guiding Principles for Business and Human Rights.149 These frameworks provide a “common global platform for action” for governments and businesses to act to prevent and remedy adverse human rights risks and impacts related to business activities and operations.150 The OECD has provided insight and standards with its Guidelines for Multinational Enterprises (OECD Guidelines),151 and the ISO has introduced direction with its Standard 26000 for “Social Responsibility.”152

The UN Global Compact was launched in July 2000 as a “platform for the development, implementation, and disclosure of responsible and sustainable corporate policies and practices.”153 It is a voluntary initiative which calls on corporations and interested stakeholders to join the Compact and commit to embracing, supporting, and enacting—within their spheres of influence—its Ten Principles, covering human rights, labor, environment, and anti-corruption standards.154 The Ten Principles are derived from the Universal Declaration of Human Rights, the International Labour Organization’s Declaration of Fundamental Principles and Rights at
Work, the Rio Declaration on Environment and Development, and the UN Convention Against Corruption. Since its inception, it has grown to contain over 10,000 corporate participants and to include stakeholders from over 130 countries.

Building from the “Protect, Respect, Remedy” framework that was passed in 2008, the UN Special Representative on Business and Human Rights developed the Guiding Principles on Business and Human Rights. The Guiding Principles provide a “common global platform for action, on which cumulative progress can be built” towards realizing the protection of, and respect for, human rights through State and business actions. They are a series of 31 practical principles to guide the implementation of the State duty to protect human rights, the business responsibility to respect human rights, and the provision of access to remedy for human rights abuses and violations. Businesses are encouraged to apply these principles appropriately according to their size, complexity, and operating contexts to ensure that they are respecting human rights.

In particular, the Guiding Principles call for businesses to adopt policies and build a corporate culture that respects human rights. They are advised to do this by implementing human rights due diligence processes to identify, prevent, mitigate, and account for how they address adverse human rights impacts arising from their business. This due diligence should include “assessing actual and potential human rights impacts, integrating and acting upon the findings, tracking responses, and communicating how impacts are addressed.” Businesses are advised to engage with stakeholders throughout the process and to be prepared to communicate their human rights impacts externally when concerns are raised or when risks of severe human rights impacts are identified.

Additionally, the UN has developed widely accepted Principles for Responsible Investing (“UN PRI”). These principles were launched in 2006 and now have almost 1200 investor signatories, with assets under management standing at more than $34 trillion—or more than 15% of the world’s investable assets. The rapid growth of the UN PRI shows that investors—in particular large, institutional investors—are quickly integrating responsible investment policies and criteria into their decision-making calculus. The UN PRI emphatically believes that environmental, social, and governance issues are materially relevant to investors and, although it recognizes the limitations of available research data, it is firm in its confidence that these issues are financially significant.

The OECD Guidelines for Multinational Enterprises (“OECD Guidelines”) provide a set of non-binding principles and standards for responsible business conduct in the global context that follow applicable local laws and internationally recognized standards. These standards are implemented through the National Contact Points (NCPs) mechanism, which are government agencies tasked with promoting the OECD Guidelines and assisting MNEs and their stakeholders in implementing the standards.
Under the Guidelines, MNEs are required to disclose material information regarding their: (1) policies and codes of conduct; (2) performance in relation to those statements and codes; (3) internal audit, risk management, and legal compliance systems; and (4) relationships with workers and other stakeholders.\textsuperscript{168} The “Commentary on Disclosure” indicates that the purpose of transparency should be to address the increasingly sophisticated public demands for information, including social, environmental, and risk reporting.\textsuperscript{169} The 2011 edition of the Guidelines aligns its human rights standards with the UN Framework and Guiding Principles.\textsuperscript{170} They require companies to “respect human rights” through: (1) policy commitments; (2) actions to prevent or mitigate adverse human rights impacts directly linked to their operations, products, or services; (3) carry out human rights due diligence appropriate to their circumstances, and (4) empower legitimate processes for the remediation of human rights impacts where they are implicated.\textsuperscript{171}

The OECD has developed sector-specific standards in the Due Diligence Guidance for Responsible Supply Chains from Conflict-Affected and High Risk Areas\textsuperscript{172} (OECD Due Diligence Guidance). The OECD Due Diligence Guidance provides a five-step process for companies to conduct due diligence, undertake risk assessments, mitigate and monitor risks in the supply chain, and participate in audit programs for external, independent assurance.\textsuperscript{173} Finally, the process requires annual disclosure of risk assessment reports, detailed descriptions of how due diligence processes have been reviewed and verified, and what steps are taken to regularly monitor changing circumstances of supply chains.\textsuperscript{174}

The ISO has developed a standard to reflect consensus, state-of-the-art standard best practice for social responsibility to assist organizations in contributing to sustainable development.\textsuperscript{175} Through a holistic approach that incorporates seven core subjects, the ISO 26000 standard provides practical guidance on how to adopt principles of social responsibility, recognize that responsibility, and engage with stakeholders to integrate that responsibility throughout an organization.\textsuperscript{176} For human rights, ISO 26000 guides organizations to implement due diligence, monitor and mitigate risks, avoid complicity, and support the resolution of grievances.\textsuperscript{177} It describes these issues in relation to broad categorization of human rights, including civil, political, economic, social, cultural, and labor rights.\textsuperscript{178}

\textit{European Union Legislation}

The European Commission (EC) has recently proposed a directive on non-financial disclosure requirements that would, in part, require corporations to report publicly their respect for human rights. The proposed standards would require companies to report relevant and material information on policies, results, risks, and risk management efforts pertaining to respect for human rights, as well as other environmental, social, and governance issues.\textsuperscript{179} The proposal is currently awaiting a vote in the European Parliament, after which it would come into force in 18
months. At that time, EU member-state governments would be required to begin the process of implementing the standards into national domestic law. The actual standards of non-financial disclosure required regarding specific types of information may vary from State-to-State but the EU directive will provide the basic requirements.

**Multi-Stakeholder Initiatives (MSIs)**

There are a number of MSIs developed through business and civil society leadership to address sector-specific or issue-specific concerns relating to the intersection of business and human rights. Through these platforms, stakeholders have worked together to formulate strategies and exchange feedback to develop operational approaches to address adverse human rights risks and impacts. Examples of MSIs include the Extractives Industry Transparency Initiative (“EITI”) and the Global Network Initiative (“GNI”).

The EITI is a global standard to promote revenue transparency and accountability in the extractive sector.\(^{180}\) It requires companies to report payments to governments and governments to disclose their receipts of payments to the EITI multi-stakeholder oversight group, which verifies and reconciles tax and royalty payments from resource extraction operations. A multi-stakeholder group representing business, civil society, and governments oversees the process and communicates the EITI Report findings.\(^{181}\) The goal is that, by requiring both sides to transparently report their exchange, the independent verification will prevent under-reporting and combat corruption and bribery in resource rich countries with poor governance, which can often contribute to conflict and a high risk of human rights violations.\(^ {182}\) Governments are required to apply to be a member of EITI and must effectively implement all aspects of the EITI requirements in order to become a member.\(^ {183}\) Failure to effectively implement the requirements can result in EITI suspending operations, as recently occurred in the DRC.\(^ {184}\)

The GNI is a sector-specific, multi-stakeholder initiative for the information and communications technology (“ICT”) industry that requires participating companies to implement its Principles on Freedom of Expression and Privacy to protect and advance the enjoyment of these human rights globally.\(^ {185}\) Implementation of the Principles includes a Governance, Accountability, and Learning process that requires participating companies to submit to independent compliance monitoring and transparent reporting that outlines compliance activities, results of independent assessments, impacts on freedom of expression and privacy, and the path forward.\(^ {186}\)

Recent legislative, regulatory, and other developments clearly indicate that policy-makers at the federal, state, and international levels are increasingly interested in taking action to address adverse human rights risks and impacts related to globalized business activities. Domestic legislators have enacted transparency requirements to address public interest in eliminating direct
or indirect support for corrupt governance, violent conflict, and human trafficking. International organizations have been engaged in creating consensus and global standards for business responsibilities related to human rights and have gathered global support for concerted action to implement those principles. Business and civil society actors have engaged with the international community to take direct action on specific concerns and in specific contexts through practical operational frameworks. Altogether, these recent developments indicate the increasing materiality of human rights-related matters to corporate activities.

B. Potential Impact of Human Rights-Related Matters on Public Companies

The “business case” for disclosure of human rights information rests on growing evidence that human rights performance has a real impact on long-term corporate value. As investors learn how companies predict, mitigate, and manage risks and impacts, capital should be allocated efficiently to businesses with stronger capacities to overcome challenges. Therefore, in an efficient market, the potential direct and indirect impacts of human rights-related matters are material to investor decision-making.

Direct impacts—such as capital costs related to compliance with laws and regulations, financial penalties for non-compliance, or damages related to liability for abuses or violations—are material risks that affect the future corporate outlook. Indirect impacts—such as the market effects of rising supply chain costs, increasing prices of raw materials, or changes in the competitive advantage based on varying capability to attract and retain workers, customers, clients, or users—could materially affect corporate performance. Finally, political effects—arising from human rights risks and impacts connected to business activities, operations, or relationships—may have a material impact on business and the social license to operate.

I. Direct Impacts

Dealing with human rights-related matters directly impacts corporate performance through additional costs, changes in operating conditions, and unpredictable delays in production and revenue generation. Investors are materially interested in the potential and actual costs that a company faces related to human rights risks and impacts because these directly impact corporate financial performance and securities valuations. Where new laws or regulations add compliance requirements, there are costs associated with complying. Where a company is implicated in human rights abuses or violations, they will face costs in mitigating the impacts, additional expenses in public relations, and potentially for litigation, mediation, or some other grievance or remediation process. Where human rights abuses or violations occur in one operating context, a company may face extra costs in re-assuring its stakeholders that its other
operations are not subject to the risk of similar incidents. Based on the potential for these direct impacts—where a human rights risk or change in political environment resulting in stronger human rights regulation is a possibility—the expected direct costs of those eventualities are material to investors’ valuations of securities.\(^{190}\)

**II. Indirect Impacts**

The indirect costs related to human rights risks are more difficult to predict and are much more costly to business. These can arise in the form of reputational damage, changes in consumer preferences that alter the definition of competitive advantages in the marketplace, or unexpected changes in local upstream conditions that cause price and cost fluctuations in the supply chain. Other indirect impacts may occur, and each of these is material to corporate performance as a result of human rights risks or impacts.

One of the most powerful costs from implication with human rights risks or impacts related to business activities is the reputational cost.\(^{191}\) This affects relationships with consumers or clients,\(^{192}\) employees and recruits,\(^{193}\) and investors and shareholders\(^{194}\) who prefer to disassociate from operations that are complicit with adverse human rights outcomes.

If human rights risks and impacts are discovered by one actor in a particular sector, the ripple effect can re-define competitive advantage by changing public perception of the consequences of their consumer decisions.\(^{195}\) This can radically alter the landscape for strategy to gain market share and consumer confidence and leave companies unprepared to show that they respect human rights risks at the back of the pack. As was witnessed with the growth of the fair trade coffee campaign, the major chain coffee shops faced pressure from consumers to carry fair trade coffee, reflecting their new understanding of the indirect costs of their purchasing decisions.\(^{196}\) Some consumers were no longer satisfied with their previous criteria for coffee and instead chose to shop based on ethical supply chain practices of coffee merchants.

Finally, human rights risks in the supply chain can result in sudden changes to supply costs or prices for raw materials where conditions deteriorate or where regulation gets stronger to improve conditions. As conditions improve and regulations get stronger in countries where low labor standards keep supply chain costs low, the increase in costs will necessarily be passed up the supply chain and increase costs on the end-producer.\(^{197}\) If conditions in supply chains change rapidly, for better or for worse, the resulting impact on manufacturing costs or raw materials prices may have a material impact on corporate performance.
III. Political Effects That Could Have a Material Impact on Business and Operations

Companies that are implicated in human rights abuses or violations may face greater scrutiny from government licensing agencies, and popular pressure could force the government to revoke or deny business licenses necessary to operate within the country.\textsuperscript{198} This is a particular risk for major foreign multinational enterprises engaged in high-risk activities such as resource extraction, where public relations are strained by the nature of exporting natural resources from the land for a limited return to local populations.\textsuperscript{199} Where society becomes passionately inflamed against a company that is complicit with human rights abuses, the government may have no choice but to follow the revocation of the social license to operate with a revocation or denial of the official business license to operate.\textsuperscript{200} Alternative scenarios could include changes in government, resulting in the nationalization of particular industries or a rapid descent into civil conflict.\textsuperscript{201}

C. Current Sources of Human Rights-Related Disclosure Regarding Public Companies

Business managers and accountants have voluntarily recognized the materiality of human rights-related information in some cases and have generally recognized the value of reporting social sustainability information informally as a public relations practice.\textsuperscript{202} Auditing firms have directly recognized that human rights and other environmental, social and governance factors are material to investors and that businesses should investigate, assess, and disclose their risks and impacts where these are material to business performance.\textsuperscript{203} Market analysts are gathering information on businesses’ social and human rights records and risks,\textsuperscript{204} and investment news services are providing analysis to the market in recognition of the materiality of these factors to decision-making.\textsuperscript{205}

Voluntary disclosures by business and marketplace aggregation and publication of environmental, social, and governance factors show that this information is material to investment decision-making. The SEC considers the availability and current sources of disclosures in determining whether information is material. First, the SEC considers whether shareholders are demanding the information from public companies through the shareholder proxy proposal process. Second, it considers whether institutional investors or other groups are petitioning the SEC for interpretive advice for disclosing the information. Finally, it evaluates the existing public disclosures available through alternative sources.
I. Increasing Calls for Human Rights-Related Disclosure by Shareholders of Public Companies

Shareholder resolution proposal powers have been a primary tool to engage corporations in dialogue relating to human rights policies and practices for decades, and resolutions have frequently been advanced where dialogue has been unsuccessful. In 2013 alone, thirteen of the biggest corporations in America faced shareholder resolutions relating to human rights. Many social-issue proposals brought by shareholders are withdrawn prior to the annual meeting because an agreement is reached with the company. The majority of human rights proposals over the past four decades have been filed by institutional investors, such as the Interfaith Center on Corporate Responsibility (ICCR), the California Public Employees Retirement System, or the New York State Common Retirement Fund.

Shareholder proposals—and even just the potential to bring proposals—have been a useful tool for engaging corporations in dialogue to enhance their transparency regarding human rights issues, although few have achieved majority support as Boards routinely advocate voting against any social disclosure proposals. The As You Sow Foundation has used shareholder advocacy to lead or participate in hundreds of shareholder dialogues and resolutions to impact policies and practices at companies, including Chevron, ExxonMobil, Dell, HP, PepsiCo, Starbucks, Target, Home Depot, and Walt Disney. As You Sow generally operates by building coalitions with shareholder allies and engaging companies in proactive dialogue—resorting to active resolution proposals where dialogue alone is not enough to spur companies to action. Other groups, such as Investors Against Genocide, advocate similar tactics for institutional investors to bring companies to align with their principles for responsible investment and have successfully promoted a shareholder resolution at ING Emerging Countries Fund to a wide 59.8% passing margin. Additionally, shareholder activism by the New York State Comptroller has recently resulted in settlement agreements that require companies to disclose human rights risks and impacts related to their business activities.

The New York State Comptroller also acts as trustee of the New York State Common Retirement Fund and has incorporated social and human rights considerations into investment decisions and long-term valuations in recent years. Similar actions have been taken by institutional pension funds, such as the American Federation of State, County, and Municipal Employees (AFSCME) Pension Plan, which has sought to protect and enhance the economic value of its long-term investments by proposing heightened accountability and transparency by management to shareholders on issues including human rights risks arising out of companies’ operations. The U.S. Presbyterian Church also recently proposed that Caterpillar review and amend its human rights policies to conform more closely to international human rights and humanitarian standards.
II. Petitions for Interpretive Advice Submitted to the SEC by Large Institutional Investors or Other Investor Groups

The SEC has only a few petitions on record that it has received from a large institutional or other investor group, demanding interpretive advice regarding disclosure relating to human rights matters.\textsuperscript{218} However, this does not mean that investors are not interested in these issues. In fact, investor interest in human rights and other social impacts related to business activities has increased dramatically in recent years.

The socially responsible investment (SRI) industry has expanded in the United States, from controlling assets worth $639 billion in 1995 to $3.74 trillion in 2012.\textsuperscript{219} This expansion is mirrored internationally by the wide acceptance of the UN PRIs, which now command assets of over $32 trillion—approximately 15\% of the global market for securities—after launching in 2006 with signatories managing only $4 trillion in assets. SRI has grown to command significant market share and several large institutional investor groups, including pension funds and mutual funds. Even Goldman Sachs has developed its own fund based in sustainability metrics, known as GS Sustain.\textsuperscript{220}

EIRIS Conflict Risk Network is a prime example of a coalition of almost 80 institutional investors, financial service providers, and other stakeholders calling upon corporate actors to fulfill their responsibility to respect human rights and to take steps that support peace and stability in areas affected by genocide and mass atrocities, such as Sudan and Burma.\textsuperscript{221} The Network leverages the investment power of more than $6 trillion in assets under management in this mission to advocate for the corporate fulfillment of the responsibility to respect human rights in conflict environments, and coordinates groundbreaking research methods for the implementation of responsible investment policies relating to these challenging locations.\textsuperscript{222} In May 2013, the Network became a part of EIRIS—a leading global provider of research into corporate environmental, social, and governance performance.\textsuperscript{223}

This is reflected in other components of investment valuation, such as the change in metrics used to evaluate corporate market value. In 1975, tangible assets accounted for up to 80\% of the valuation assessment for corporate securities’ market value. In 2005, tangible assets accounted for only 20\% of that valuation assessment, as intangible assets—including risk management, intellectual property, human and social capital—have come to be used to calculate 80\% of the market valuation equation for corporations.\textsuperscript{224}

III. Existing Public Disclosures Available Through Other Sources

Businesses, traditional financial accounting firms, and marketplace analyst research services have recognized that human rights-related matters are material to investors. Businesses have
demonstrated this through voluntary disclosures in securities reports and participation in social sustainability reporting systems or social auditing frameworks.\textsuperscript{225} Over the past few years, financial accounting firms have expressed the materiality of human rights to investors in several reports from Deloitte, Ernst & Young, and others that have engaged in research collaborations with business schools and institutional investor groups.\textsuperscript{226} Finally, market analysts and research companies have developed indices for measuring social impacts, including human rights risks and impacts, of business activities and offer these for investors who are seeking to apply the information in their decisions.

\textbf{Voluntary Reporting in Periodic SEC Securities Disclosures}

Many businesses are already voluntarily disclosing information regarding human rights-related matters,\textsuperscript{227} and both accounting and law firms have published their acknowledgment that these matters are material to investors.\textsuperscript{228} Certain companies, including Coca-Cola, have already begun to report human rights risks under their “Risk Factors” disclosures in item 1A of their annual Form 10-K securities reports to the SEC.\textsuperscript{229} As companies proceed to identify, monitor, and address human rights risks and impacts in their activities, the acknowledged materiality of these matters by accounting firms may result in those firms and in-house corporate auditors deciding to report human rights-related matters when they pass the in-house materiality filter for significant relevance to investors and shareholders.

In their 2012 annual report, Coca-Cola specifically details concerns that negative publicity related to human rights, even if unwarranted, could damage their brand image and corporate reputation and cause the business to suffer.\textsuperscript{230} This risk factor disclosure rests on Coke’s recognition that their success “depends on our ability to maintain the brand image” and “maintain our corporate reputation.”\textsuperscript{231} Coke addresses their responsibility to respect human rights under the Guiding Principles and acknowledges that—based on their Human Rights Statement, including a Workplace Rights Policy and Supplier Guiding Principles—any allegations of a failure to respect internationally accepted human rights could have a significant impact on their corporate reputation.\textsuperscript{232} They conclude that the reputational harm attached to any allegations of human rights violations, even if untrue, could significantly impact corporate reputation and long-term financial results.\textsuperscript{233}

The analysis provided by Coca-Cola of the risks related to human rights violations, or even untrue allegations, to long-term financial results are consistent with the views emerging from accounting and auditing firms acknowledging that human rights issues are material to investors. Deloitte has proposed that environmental, social, and governance information, including information related to human rights matters, are material where disclosure informs an understanding of changes in company valuation.\textsuperscript{234} They indicate that the materiality filter should capture these topics by considering how stakeholder actions related to reported
information regarding topics such as human rights risks and impacts—including boycott, activism, divestiture, seeking employment, or changing purchasing habits—yield potential impacts for company valuations within a relevant time frame.  

Ernst & Young, in collaboration with the Boston College Center for Corporate Citizenship, has also recently identified the benefits of corporate transparency for financial performance. Their research shows that informally reporting social sustainability performance has demonstrated direct benefits to the corporate balance sheet—a conclusion that implies information such as human rights risks and impacts are material to corporate performance. The conclusions of both Deloitte and Ernst & Young’s research shows that traditional accounting firms are finding that non-financial information, such as human rights risks and impacts, may be material to investors as they impact corporate performance financially or, in the alternative, lead to intangible advantages to reputation and image.

Voluntary Informal Social Sustainability or Responsibility Reporting

There has been a proliferation of voluntary social sustainability reporting frameworks, and a significant majority of businesses are participating by voluntarily releasing informal corporate social responsibility or sustainability reports. The Global Reporting Initiative (GRI) and the International Integrated Reporting Council (IIRC) are the most popular frameworks, and the Sustainability Accounting Standards Board (SASB) is also developing human rights and sector-specific disclosure standards to guide companies. Companies have subscribed to these standards in order to grant their reports a level of credibility, but most of the standards have still allowed companies considerable discretion in reporting details. These standards have made more information available, but the quality, comparability, and usefulness of the information varies across sectors and between businesses. Therefore, informal voluntary sustainability reports have been useful in making some information available to investors, but they have failed to allow investors to clearly understand, evaluate, and compare how different companies are identifying, reviewing, mitigating, and remedying human rights risks and abuses.

The GRI was initiated in 1990 and the first reporting standard was announced in 2000, providing companies with a framework for reporting on sustainability topics. The standard has evolved over time, with the fourth “G4” guidelines released in May 2013. The guidelines have been designed to harmonize with existing sustainability standards, including the OECD Guidelines for Multi-National Enterprises (MNEs), ISO 26000, and the UN Global Compact. In 2011-2012, more than 3900 companies participated in GRI certification training.

Under the G4 Guidelines, companies may prepare a sustainability report “in accordance” with the standard by reporting only the “Core” elements or by preparing a “Comprehensive” report, including additional “Standard Disclosures” and more extensive performance analysis of
identified material “Aspects.” The determination of aspects of the GRI reporting standard that are material to the specific company is instrumental in determining what disclosures are made under the standard, since only aspects that are material to the company must be reported under the GRI standard. Under the G4 guidelines, material aspects are those that: (1) “reflect the organization’s significant economic, environmental, and social impacts” or (2) “substantively influence the assessments and decisions of stakeholders.”

The IIRC is an international standard for integrated corporate reporting that is currently piloting a program to result in communication by companies about how their “strategy, governance, performance and prospects lead to the creation of value over the short, medium, and long term.” The integrated reports are intended to target investors and decision-makers in capital markets by communicating the full range of factors that materially affect the issuer’s ability to create value over time. The IIRC envisions its standard as building on financial and other reporting to evolve corporate reporting to consider all aspects that interested stakeholders find relevant in capital allocation decisions. These integrated reports will identify the factors that the organization believes are most important for their value creation over time and will provide additional details including financial statements and sustainability reports. In that way, it complements and works with the GRI standards to incorporate sustainability reports alongside financial statements to reflect the integrated information that is material to investors.

The SASB is a standards organization that is developing sector-specific accounting standards related to material issues in those sectors for corporate reporting of non-financial information. SASB aims to provide relevant, useful, applicable, cost-effective, comparable, complete, directional, and auditable standards to improve the quality of corporate reporting for investors. In developing their standards, they seek to support the convergence of international accounting standards and support the shift to integrated reporting of material sustainability issues in SEC reports such as the Form 10-K. They are in the process of developing standards related to accounting and reporting human rights issues in order to continue towards meeting their vision where industry-specific standards enable companies to compete and improve performance on sustainability issues—such as respect for human rights—so that investors can capitalize the most sustainable companies.

Marketplace Information Analysis and Investor Analytical Services

The marketplace has naturally organized to provide analytical services, information aggregation, and dedicated news categories to sustainability and human rights matters relating to business activities. Investor analytics and research database firms have been providing and refining indices and collections of information relating to environmental, social, and governance business practices, including human rights, for years. Investor-focused news services are dedicating web pages to reporting social impacts of business and sustainability issues.
The MSCI risk and investment analytics firm produces indices for its clients related to environmental, social, and governance analysis and is related to socially-responsible investment criteria.\(^{255}\) MSCI has consolidated many of the competing databases and indices under its umbrella with the KLD Research & Analytics, RiskMetrics, and Barra analytical methods offered to clients as part of their investment support tools.\(^{256}\) These tools can be customized to meet particular investors’ interests in analyzing performance related to specific categories, including human rights. Goldman Sachs has developed its own analytical approach to sustainability metrics, and incorporated it into a sustainable and principled investment fund.\(^{257}\)

Bloomberg, the investment news provider, has a dedicated category for sustainability news, where human rights matters related to business activities are reported regularly.\(^{258}\) Bloomberg has maintained a database that integrates sustainability into its market analytics since 2008 and has expanded its commitment to providing investors transparent information on these issues by offering a sustainability section in its news services since 2010.\(^{259}\) However, the fact that this information is being provided by the information services marketplace does not mean that it is equally reliable, comparable, or useful to investors—SEC action to specifically require human rights disclosures could vastly improve the quality of information available to investors and stakeholders.\(^{260}\)

The problem with these marketplace information and analytical resources for investors is that they are relying on incomplete, inconsistent, and sometimes incomparable information from companies. The data deficiency holds back the measurement of financial impacts from socially responsible corporate policies and processes and prevents investors from adequately incorporating this information into their decision-making process.\(^{261}\) Although business, institutional investment funds, and marketplace information services providers have recognized that this information significantly alters the total mix of information available to investors, there is no standardized practice for delivering useful, objective data.\(^{262}\)

The availability of current sources of human rights-related disclosure shows that businesses, accounting firms, civil society, news services, and other stakeholders expect investors to be interested in human rights for making capital allocation decisions. As shareholders and investors are demanding increasingly detailed and sophisticated disclosures related to human rights matters using shareholder resolutions, information providers are filling the gap in available information as best they can. Investors are demanding information by adhering to international standards of socially responsible investment principles and criteria. Businesses are voluntarily disclosing information by including it in existing items of their SEC formal reports or by informally providing public sustainability or corporate social responsibility reports. International standards for these sustainability reports have developed in order to guide companies to report material information in a clear, useful manner. Finally, marketplace information analysis providers, major investment and brokerage houses, and business news publications are including sustainability and human rights information prominently in their metrics and news services.
Unfortunately, this information is not consistent, comparable, or reliable across industries and even individual businesses—making it less useful to investors.
Reporting Material Human Rights Information to the S.E.C.

Broad human rights disclosure allows shareholders to access comparable information about corporate activities and to more adequately assess risks to their portfolio companies. This section outlines the two steps involved in implementing securities disclosure in the context of this type of broad human rights disclosure: (1) assessing business-related human rights risks and impacts through human rights due diligence and disclosure of such processes and (2) disclosing material human rights risks and impacts.

Under the second step of broad human rights disclosure, this section proposes two ways in which the SEC should act to require companies to disclose material human rights information under Regulation S-K. First, the SEC should issue interpretive guidance, clarifying the responsibilities of issuers to disclose material human rights risks, impacts, and due diligence processes and results under existing Regulation S-K reporting items. Second, the SEC should engage in a comprehensive rulemaking process to develop rules for disclosing human rights risks, impacts, and due diligence processes and results in a distinct reporting item. Engaging in either or both of these approaches will allow the SEC to enable investors to access key information that addresses management’s integrity and a corporation’s capacity to manage risks and create long-term, sustainable value through respect for human rights in business activities and relationships. Any clarification from the SEC, whether in the former of interpretive guidance or a new rule, should clearly extend disclosures to include the activities of a company’s subsidiaries, contractors, and business partners, in line with the standards of the UN Guiding Principles and the OECD Guidelines for MNEs.

A. Assessing Human Rights Risks and Impacts Related to Business Activities: Human Rights Due Diligence

The first step in securities disclosure always involves gathering, reviewing, and assessing information that fits within specifically required disclosure items. In this case, human rights risks and impacts related to business activities can arise from a variety of sources and may develop from supply chain or other business relationships, as well as directly in principal business operations. In order for issuers to effectively identify, review, mitigate, and report human rights risks and impacts related to their activities, they should conduct human rights due diligence.

Generally, human rights due diligence should involve several steps to: (1) identify risks and impacts, (2) review and integrate findings, (3) track responses and mitigate potential impacts, (4) remedy any existing adverse impacts, and (5) communicate to stakeholders how impacts are addressed. The UN Guiding Principles, in Principles 17-20, provide a flexible framework for
issuers to adapt based on their size, complexity, risk environment, and operational context. By referencing these existing and developing standards, companies can provide clarity to investors while having the flexibility to adapt best practices (or not) as they emerge over time. Sector specific guides—like the OECD Due Diligence Guidance, which is geared towards supply chain due diligence in conflict-affected and high-risk areas—also provide a framework for human rights due diligence that could be used as an illustration by the SEC, while leaving the exact parameters of due diligences processes, if any, to issuers.

B. Disclosing Material Human Rights Risks and Impacts

The second step for making securities disclosures is filtering and appropriately organizing the gathered information in material disclosures to allow investors and shareholders to understand corporate performance and prospects. The material information must be disclosed and organized in reports according to required disclosure items. In this case, material human rights information could be required to be disclosed based on: (1) existing securities regulation disclosure items or (2) the implementation of a new rule providing for a new item sub-heading for human rights-related risks and impacts.

I. Interpretive Guidance on Existing Securities Reporting Item Requirements for Human Rights-Related Matters

Material human rights risk and impacts should already be being disclosed by issuers under existing requirements in Regulation S-K, but the SEC should clarify these requirements using an interpretive guidance for human rights-related matters. Following the approach recently used to clarify reporting requirements for climate change matters and cyber-security information, the SEC should identify how issuers are required to disclose material human rights information under existing rules. In particular, the description of business (Item 101), legal proceedings (Item 103), reporting of disclosure controls and procedures (Item 307), MD&A (Item 303), and risk factors (Item 503(c)) may already require disclosure of material human rights information.

Human rights risks and impacts are relevant to disclosures under item 101, the description of business, because they are a significant element of operating contexts where they exist. Further, any policies and processes in place to identify, assess, mitigate, and remedy human rights risks and impacts will be relevant to investors’ understanding of an issuer’s risks management strategies and capacities. These should be outlined and described in detail, and any known or potential risks should be disclosed in the description of business as part of the description of the plan of operation for the next period.
Legal proceedings related to human rights risks and impacts should be disclosed under item 103. The SEC should clarify that legal proceedings involving allegations of human rights abuses or violations are not “ordinary routine litigation incidental to the business” and thus are material to investors. As has been suggested by Coca-Cola and stakeholder research, even untrue allegations of human rights violations can have a material impact on corporate reputation and long-term value. Similar to legal proceedings related to climate change, there is sufficient evidence to support disclosure of legal proceedings implicating a corporation or any subsidiary or business segment in human rights violations at a lower standard of materiality than is generally required for item 103 disclosures.

Further, as management is required to provide a narrative perspective of business performance, including trends, uncertainties, and future prospects, there should be some discussion of human rights risks and impacts in the MD&A under item 303. Any known or uncertain trends relating to human rights risks and impacts should be described and management should provide a narrative explanation of how the issuer is prepared to identify, prevent, and mitigate potential or existing occurrences.

Human rights due diligence policies and procedures should be disclosed as part of the item 307 reporting of disclosure controls and procedures. These reports should include: (1) the concrete steps taken to identify risks to human rights; (2) the results of the company’s inquiry, including risks and impacts identified; and (3) steps actually taken to mitigate the risks and prevent human rights abuses. This would require senior management to assess and take responsibility for the effectiveness of these internal controls and procedures and vouch for the resulting human rights disclosures.

The direct and indirect effects to securities valuations, corporate reputation, and competitive advantage related to human rights risks and impacts should result in material disclosures under item 503(c) as risk factors for corporate performance. Coca-Cola has led the way with their recognition that the potential for damage to their reputation and resulting stakeholder actions could significantly affect their bottom line. It is clear from the consistent findings of research on the impact of sustainability reporting that social responsibility issues, including human rights, are important sources of risk and potential value. The SEC should clarify that issuers need to be assessing their human rights risks and impacts to identify risk factors for disclosure under item 503(c) that could affect corporate performance.

II. The Development of a New Rule for Human Rights Reporting

The SEC may engage in rulemaking related to required disclosures where it is mandated by Congress under existing securities laws (such as the Exchange Act or Dodd-Frank Act), according to a fresh congressional mandate, or following rule-making petitions proposed by the
According to Section 14(a) of the Securities Act, Congress has delegated broad authority to the SEC to engage in rulemaking relating to proxy solicitations “as necessary or appropriate in the public interest, or for the protection of investors.” As this paper has documented, human rights risks and impacts are a matter of domestic and global public interest, and are relevant to corporate performance and the protection of investors. Interested stakeholders should petition the SEC to promulgate a new mandatory disclosure rule related to human rights in periodic disclosures, including through annual proxy disclosures and through updates in periodic disclosures regarding material changes.

In developing a new rule, the SEC should consider how to incorporate disclosures of human rights-related matters in order to provide clear, consistent, and comparable information between issuers. Certain sectors will, due to the nature and context of their operations, be more prone to risks and impacts related to human rights. Disclosure of their policies and processes for identifying, tracking, mitigating, and remedying those risks and impacts are materially relevant to investors’ understanding of management’s integrity, and capability to manage risks.

A new rule—and the rulemaking process—could investigate the value of consolidating human rights risk and impact disclosures under one item heading or sub-heading. This “Human Rights Due Diligence” section would provide transparent and accountable disclosure of all material information and allow stakeholders to engage the corporation to improve or assist with issues related to human rights. Finally, this rule could be used to meet part of the U.S. government’s duty to protect human rights-related to business activities, under the UN Guiding Principles, which it has already endorsed. This would require, at minimum, that the rule include a disclosure of the issuer’s human rights policies and details of the human rights due diligence process and results.
Conclusion

Heightened interest from the public, policy-makers, academics, investors, and businesses indicate that information relating to human rights matters is in fact material to investor decision-making. Domestic and international legislative and policy action have built—and continue to build—a global consensus around the need to tackle the adverse social and human rights impacts of globalized business activities. Investors are increasingly demanding corporate transparency through shareholder resolutions and endorsement of responsible investment principles. In turn, businesses are recognizing the importance of their performance relating to social responsibility issues and are publishing both formal and informal reports to gain positive publicity and investor support for their efforts in meeting these changing global standards. At the same time, marketplace information analysts and investor support service providers are gathering and integrating available information into useful analyses for investors’ capital allocation decisions.

The UN Guiding Principles provide a set of foundational benchmarks for building human rights considerations into internal auditing and risk mitigation processes through human rights due diligence and reporting. Since the United States government has endorsed the Guiding Principles, it should examine implementation of these Principles through its own existing laws and regulations. Furthermore, the OECD Guidelines for MNEs and ISO 26000 have entrenched and expanded upon the Guiding Principles to formulate best practices standards for corporations around the world to tackle the challenges of business impacts relating to human rights. These systems have developed as legislators, civil society, and businesses have converged on a common understanding of the responsibility for businesses to respect human rights. The implementation of the responsibility to respect human rights demands that corporations conduct human rights due diligence to investigate their operations for adverse human rights risks and impacts and communicate those findings to stakeholders and the public.

In order to promote orderly, efficient capital markets and protect investors from misleading or inaccurate information that affects the value of the securities on the market (such as in stand-alone social reports), the SEC should act to require issuers to disclose their human rights due diligence processes and findings regarding risks and impacts related to their business activities. Under existing securities regulations, issuers may have an obligation to disclose human rights risks and impacts related to their operations, and the SEC should provide interpretive guidance clarifying those items where material human rights issues should be reported. Based on the heightened interest from the public, legislators, the international community, and voluntary business disclosures, the SEC should provide interpretive guidance and engage in a comprehensive rulemaking process to establish clear, consistent, and comparable disclosure requirements that will allow investors to effectively consider the human rights risks and impacts connected to investment in certain companies. This information is highly important as it significantly alters the total mix of available information to investors. It should therefore be provided in a manner that adequately allows investors to usefully decide how to allocate their resources.
Endnotes

1 The United States does have several statutes that apply certain laws and standards to U.S. companies in their activities abroad. These include the Foreign Corrupt Practices Act, Pub. L. 95-213 (1977), the Torture Victim Protection Act, Pub. L. 102-256 (1991), and the Trafficking Victims Protection Reauthorization Act, H.R. 7311 (2008). The Alien Tort Claims Act, 28 U.S.C. § 1350 (2013) has been used in recent decades to hold companies liable for violations of the law of nations committed abroad.

2 Many human rights violations resulting from business activities occur in challenging political environments, where conflict or other high-risk factors have limited the capacity or willingness of the State to effectively establish the rule of law or to operate a functioning judiciary.
